

Sponsor plan: compatibility highlights

EROS MARKETS | Recheck of docs/SPONSOR_INTEGRATION_PLAN.md | 04 October 2026

Verdict: The plan fits Eros's core architecture. No wholesale risk-engine, CLOB or custody rewrite is indicated. The issues below are operational omissions, adapter work and document cleanup, not proof of existing contract bugs.

1. Keeper gas profiles are incomplete - priority fix

SP-03 lists four missing profiles, but the real-engine deadline paths also require `voidMarketRealEngine` and `voidMarketStuckRealEngine`. Both are absent; the keeper refuses jobs without measured limits. Add them and remeasure halt/finalize against the current `BookRiskEngine`, not the older seam harness. `Chunk32` names are valid gas keys; calls remain `prepareSnapshotChunk(32)` and `preparePayoutChunk(32)`.

2. Specify the PERP sampler operating job

SP-04 mentions sampling rules but does not assign a caller for `sampLePerp()`. INDEX updates do not call it automatically; inspected oracle services contain no sampler job. Schedule capture and later-block confirmation with a strictly newer INDEX observation, bounded gas, and invalidation/retry handling. Without it, normal PERP pricing is not established; some bootstrap trading can still work.

3. Complete the Perpl enrollment workflow

B12 must explicitly include both signatures: the owner's EIP-712 authorization and the API key's Ed25519 proof-of-possession over the enrollment digest. Securely persist the returned opaque X-API-Key token; it cannot be regenerated from the signing key. This is external-venue adapter work, not an Eros contract change.

4. Make Qwen transport work explicit

B18 needs structured message history, tool calls/results and response parsing beyond the existing system/user-to-text model client. For Qwen's default preserved-thinking mode, retain historical `reasoning_content` separately. Adding a provider/model name alone does not deliver the proposed multi-step agent.

Pricefeed status - user clarification: Pricefeed work is in progress and **will be pushed once completed**. Do not describe it as absent or already pushed. Reuse/review the existing packages/pricefeed work first. Current inspected adapters are deliberately local-chain-only (31337); push completion alone does not prove Monad readiness.

Small document fixes: The CRE 64-byte metadata regression already exists in `OracleReport.t.sol`; verify/rerun it rather than automatically duplicating it. Fix eight relative links broken by moving the plan into docs/.

Basis and limits: Source-level inspection of risk ref 5f8e8a4, oracle ref cb60d9c and the local pricefeed checkout. No fresh end-to-end run, deployment or sponsor enrollment. Original Markdown/code unchanged by this PDF.
